Figure 10. Disconnected streams are separated from the ground-water system by an unsaturated zone.

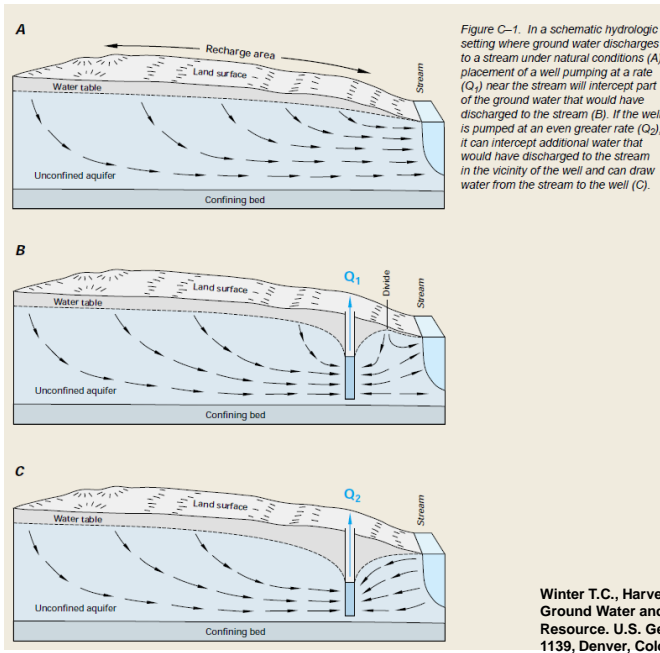

Figure 11. If stream levels rise higher than adjacent ground-water levels, stream water moves into the streambanks as bank storage.

Winter T.C., Harvey J.W., Franke O.L. (1998) - Ground Water and Surface Water A Single Resource. U.S. Geological Survey Circular 1139, Denver, Colorado.

4

Effet du prélèvement sur un forage

Figure 8. Gaining streams receive water from the ground-water system (A). This can be determined from water-table contour maps because the contour lines point in the upstream direction where they cross the stream (B).

Figure 9. Losing streams lose water to the ground-water system (A). This can be determined from water-table contour maps because the contour lines point in the downstream direction where they cross the stream (B).

Winter T.C., Harvey J.W., Franke O.L. (1998) - Ground Water and Surface Water A Single Resource. U.S. Geological Survey Circular 1139, Denver, Colorado.

7

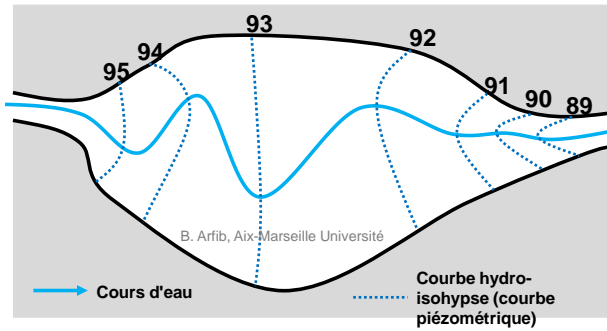

Figure 16. Lakes can receive ground-water inflow (A), lose water as seepage to ground water (B), or both

Winter T.C., Harvey J.W., Franke O.L. (1998) - Ground Water and Surface Water A Single Resource. U.S. Geological Survey Circular 1139, Denver, Colorado.

8

Nappe libre alluviale, en relation avec la rivière

+ rivière = Limite à charge imposée (condition de Dirichlet)

9

Limite à flux imposé (condition de Neumann) Cas particulier : flux nul

10

Carte piézométrique (Nappe libre de la Durance, mesures effectuées le 13/09/1997)
